Preface 1	5
Preface 2	6
Introduction	7
1 Ventilation therapy	8
1.1 Select appropriate ventilation access	8
1.1.1 Option A	8
1.1.2 Option B	8
1.2 Intubation of critical pathogen spectrum patients	9
1.3 Difficult airway	11
1.4 Select appropriate ventilation modes	12
1.5 Initial ventilation therapy setting	13
1.6 Setting the positive end-expiratory pressure (PEEP)	14
1.7 Continuously adapt ventilation	16
1.8 Optimise expiration	17
1.9 Advanced measures to support lung function	18
1.10 Monitoring	19
1.11 Assess ventilation course	20
1.12 Daily screening of respiratory situation	21
1.12.1 Start of weaning: Spontaneous Awakening Trial (SAT)	21
1.12.2 Readiness for extubation: Spontaneous Breathing Trial (SBT)	22
1.13 Non-invasive ventilation (NIV)	23
1.13.1 Non-invasive mask ventilation	23
1.13.2 Non-invasive helmet ventilation	24
1.14 High flow O ₂ therapy (HFOT)	27
1.14.1 HFOT with a ventilator	27
1.14.2 HFOT with flow meter for O ₂ feed	28
2 Patient care	29
2.1 Secretion management and endotracheal suctioning	29
2.2 Drug nebulization	31
2.3 Respiratory gas conditioning	32
2.4 Therapeutic prone positioning	34
2.5 Vascular access points	36
2.6 Demand-based nutrition of critically ill patients	38
2.7 Insulin therapy	41
2.8 Analgosedation	44
2.8.1 Analgosedation with COVID-19	44
2.8.2 Volatile anaesthetics (AnaConDa)	47
2.9 Diagnosing and treating delirium	48
2.10 Transfusion of erythrocyte concentrates	52
2.11 Donning and removing personal protective equipment	54
3 Monitoring and special patient observation	55
3.1 Blood gas analysis	55
3.1.1 Assess oxygenation	55
3.1.2 Assess acid-base status	56
3.2 Cardiac arrhythmia	57
3.2.1 Diagnosing tachycardic arrhythmias	58
3.2.2 Acute therapy of tachycardic arrhythmias	59
3.2.3 Bradycardic arrhythmias	60
3.2.4 Causes of bradycardia in intensive care	60
3.2.5 Diagnosing bradycardic arrhythmias	61
3.2.6 Advanced acute therapy of bradycardic arrhythmias:	63
3.3 Hypotension	64
3.4 Hypertension	66

3.5 Hypertensive emergency	67
3.5.1 Anti-hypertensive drugs	68
3.6 Haemodynamic instability	70
3.7 Blood culture collection	72
3.8 Chest ultrasound	73
3.8.1 Pleural effusion/pulmonary congestion	73
3.8.2 Pneumothorax	74
4 Managing difficult situations	75
4.1 Alarm management	75
4.2 Resolving problem situations in ventilation	77
4.2.1 Volume cannot be applied	77
4.2.2 Acute patient desaturation	78
4.2.3 Unstable PEEP	79
4.2.4 Monitor reset	80
4.2.5 No CO ₂ measurement	81
4.3 Diagnosis and therapy of pneumothorax	82
4.4 Decision-making in case of insufficient intensive care resources	83
4.5 Cardiovascular arrest	84
4.5.1 Cardiopulmonary resuscitation (CPR)	84
4.5.2 Post-resuscitation management	85
5 Annex	86
5.1 Nomenclature of ventilation modes	86
5.1.1 Volume-controlled ventilation modes	87
5.1.2 Pressure-controlled ventilation modes	92
5.1.3 Spontaneous ventilation modes	100
5.1.4 Hybrid ventilation modes	105
5.1.5 Closed loop ventilation modes	111
5.2 Setting parameters for intensive-care ventilation	114
5.3 Measured values	116
5.4 Arterial blood gas analysis	117
5.4.1 Reference ranges	117
5.4.2 Typical laboratory patterns associated with acid-base disorders	117
5.5 Medications in intensive care	120
5.6 Inhalation drugs	127
5.7 Richmond Agitation Sedation Scale (RASS)	128
5.8 Glasgow Coma Scale	129
5.9 Calculated oxygen concentration in high flow O ₂ therapy devices with flow meter for O ₂ supply	130
5.10 Chest ultrasound	131
5.10.1 Convex probe	131
5.10.2 Probe positions	131
5.10.3 Pneumothorax	132
5.10.4 Pleural effusion	133
5.10.5 Purulent fibrinous pleuritis	133
5.10.6 Pulmonary congestion	134
