1. Preface to current edition	5
2. Preface to current edition	6
1st preface to first edition	7
2nd preface to first edition	8
Introduction	9
1 Ventilation therapy	10
1.1 Select appropriate ventilation access	10
1.1.1 Option A	10
1.1.2 Option B	10
1.1.3 Option C	11
1.2 Intubation of critical pathogen spectrum patients	12
1.3 Difficult airway	14
1.4 Select appropriate ventilation modes	15
1.5 Initial ventilation therapy setting	16
1.6 Setting the positive end-expiratory pressure (PEEP)	17
1.7 Continuously adapt ventilation	19
1.8 Optimise expiration	20
1.9 Advanced measures to support lung function	21
1.10 Monitoring	22
1.11 Assess ventilation course	23
1.12 Daily screening of respiratory situation	24
1.12.1 Start of weaning: Spontaneous Awakening Trial (SAT)	24
1.12.2 Readiness for extubation: Spontaneous Breathing Trial (SBT)	25
1.13 Non-invasive ventilation (NIV)	26
1.13.1 Non-invasive mask ventilation	26
1.13.2 Non-invasive helmet ventilation	27
1.14 High flow O ₂ therapy (HFOT)	30
1.14.1 HFOT with a ventilator	30
1.14.2 HFOT with flow meter for O ₂ feed	31
2 Patient care	32
2.1 Secretion management and endotracheal suctioning	32
2.2 Drug nebulization	33
2.3 Respiratory gas conditioning	34
2.4 Prone positioning of spontaneously breathing, alert patients	36
2.5 Therapeutic prone positioning	38
2.6 Vascular access points	40
2.7 Demand-based nutrition of critically ill patients	42
2.8 Antidiabetic therapy	45
2.9 Anticoagulation therapy for COVID-19 patients	48
2.10 Cortisone therapy in COVID-19 patients	50
2.11 Analgosedation	52
2.11.1 Analgosedation with COVID-19	52
2.11.2 Volatile anaesthetics (AnaConDa)	55
2.12 Diagnosing and treating delirium	56
2.13 Transfusion of erythrocyte concentrates	60
2.14 Donning and removing personal protective equipment	62
3 Monitoring and special patient observation	63
3.1 Blood gas analysis	63
3.1.1 Assess oxygenation	63
3.1.2 Assess acid-base status	64
3.2 Cardiac arrhythmia	65
3.2.1 Diagnosing tachyarrhythmias	66
3.2.2 Acute therapy of tachyarrhythmias	67
3.2.3 Bradyarrhythmias	68
3.2.4 Causes of bradycardia in intensive care	68
3.2.5 Diagnosing bradyarrhythmias	69
3.2.6 Advanced acute therapy of bradyarrhythmias	71

3.3 Hypotension	72
3.4 Hypertension	74
3.5 Hypertensive emergency	75
3.6 Haemodynamic instability	76
3.7 Blood culture collection	78
3.8 Chest ultrasound	79
3.8.1 Pleural effusion/pulmonary congestion	79
3.8.2 Pneumothorax	80
4 Managing difficult situations	81
4.1 Alarm management	81
4.2 Resolving problem situations in ventilation	83
4.2.1 Volume cannot be applied	83
4.2.2 Acute patient desaturation	84
4.2.3 Unstable PEEP	85
4.2.4 Monitor reset	86
4.2.5 No CO ₂ measurement	87
4.3 Diagnosis and therapy of pneumothorax	88
4.4 Decision-making in case of insufficient intensive care resources	89
4.5 Cardiovascular arrest	90
4.5.1 Cardiopulmonary resuscitation (CPR)	90
4.5.2 Post-resuscitation management	91
5 Annex	92
5.1 Nomenclature of ventilation modes	92
5.1.1 Volume-controlled ventilation modes	93
5.1.2 Pressure-controlled ventilation modes	98
5.1.3 Spontaneous ventilation modes	106
5.1.4 Hybrid ventilation modes	111
5.1.3 Closed loop ventilation modes	117
5.2 Setting parameters for intensive-care ventilation	120
5.3 Measured values	122
5.4 Arterial blood gas analysis	123
5.4.1 Reference ranges	123
5.4.2 Typical laboratory patterns associated with acid-base disorders	123
5.5 Medications in intensive care	124
5.6 Inhalation drugs	131
5.7 Richmond Agitation Sedation Scale (RASS)	132
5.8 Glasgow Coma Scale (GCS)	133
5.9 Calculated oxygen concentration in high flow O ₂ therapy devices with flow meter for O ₂ supply	134
5.10 Chest ultrasound	135
5.10.1 Convex probe	135
5.10.2 Probe positions	135
5.10.3 Pneumothorax	136
5.10.4 Pleural effusion	137
5.10.5 Purulent fibrinous pleuritis	137
5.10.6 Pulmonary congestion	138
